FREE LIGHTNESS

Flying mode:

Is especially good to cover shorter distances in the air. It is designed to fly perfectly at the top of the cliff on steep coasts. You can cover distances that no one else can.

Floating mode:

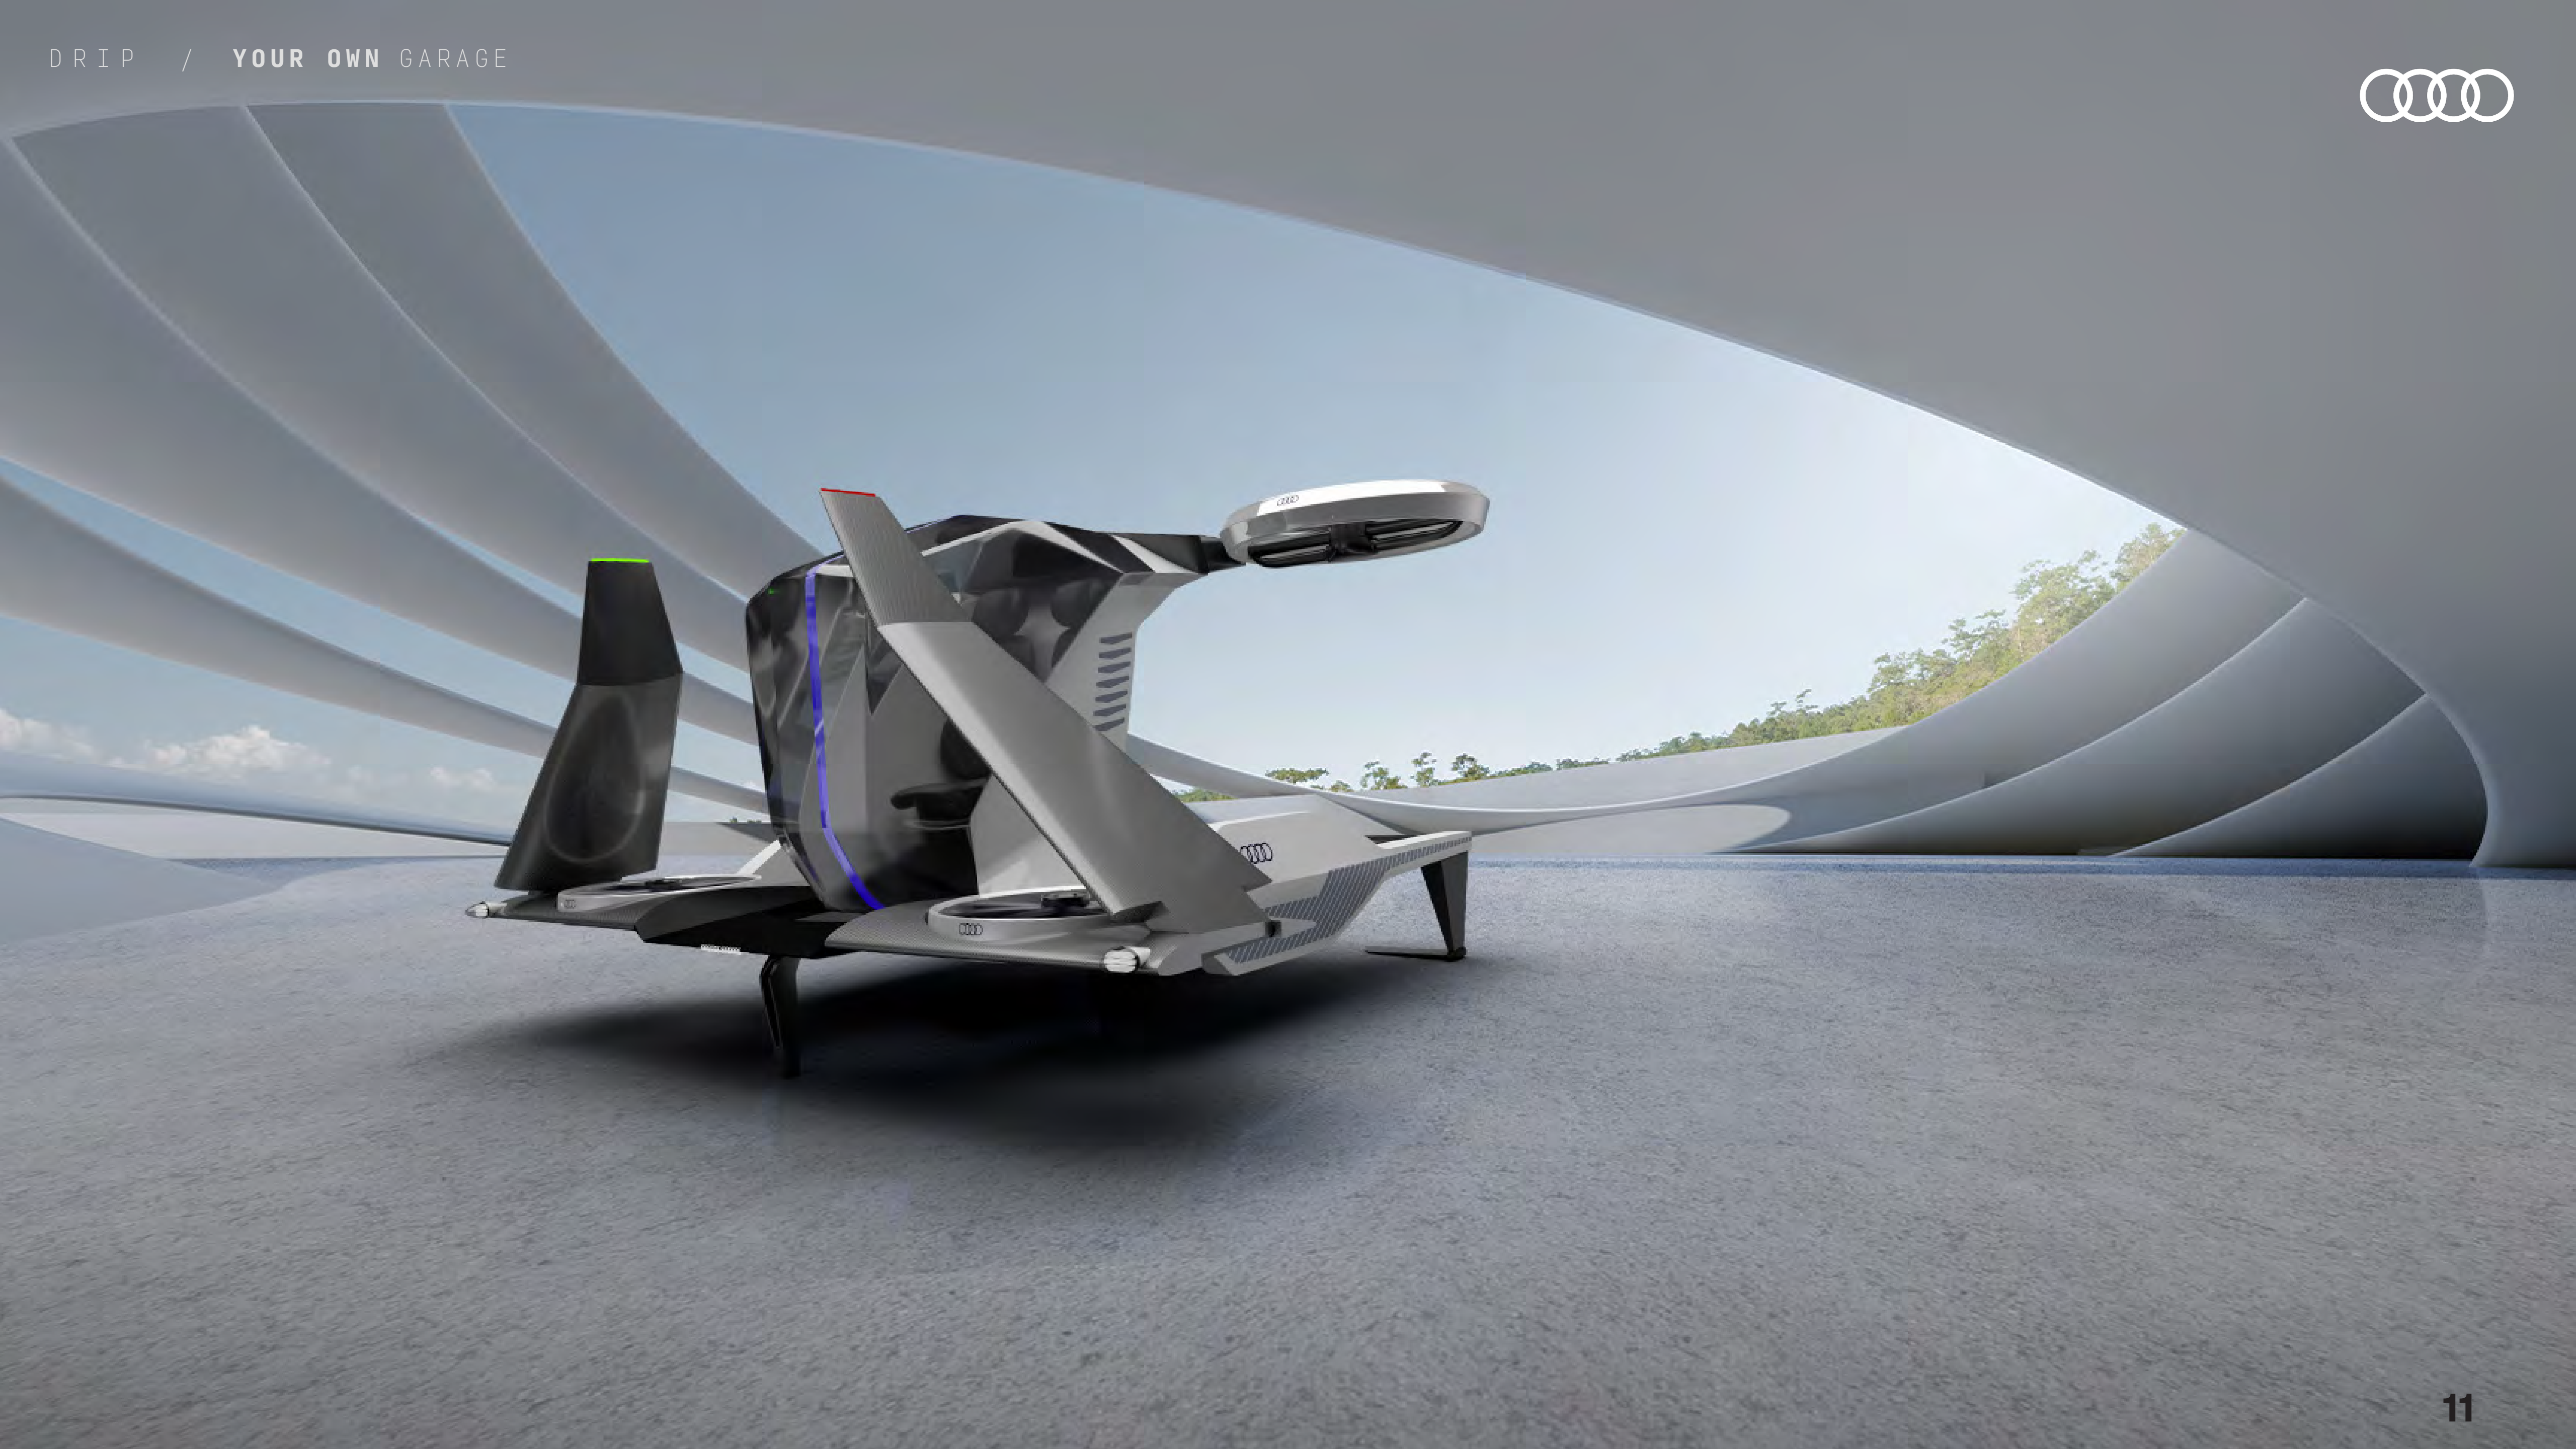

The drone travels on the water according to the principle of aerofoils. Thus you save a lot of energy, since the resistance in the water is greatly reduced.

Parking mode:

You can land the drone at the top of the cliff to enjoy the view. At the back of the drone is a trampoline where you can lie down and relax.
